Continuation of 5. does NOT place the application in condition for allowance because: Applicant argues the cited references do not disclose an intermediate layer having a thickness that is dependent upon a critical energy value specific to a material of the intermediate layer and representative of an energy necessary for propagation of a crack initiated in the intermediate layer. Examiner maintains the thickness of the intermediate layer is optimizable and directly affects the damping property of the laminated glass pane. It would have been obvious to one of ordinary skill in the art to optimize the intermediate layer because discovering an optimum value of a result effective variable involves only routine skill in the art.
